

85 connect to negative pole

86 connect to positive pole

OFF-ON Start

When the voltage is slowly adjusted from 0V to about 6.5V ($\pm 1.5V$) (it must be adjusted to 12V finally), the switch will act and switch from large current to small current (it is very important to note), At the same time, 30-30A and 31-31A are respectively in conducting "On" state.

ON-OFF Release

When the voltage is slowly adjusted from 12V to about 4.0V ($\pm 1.5V$), the switch will act and switch from a small current to a large current. 30-30A and 31-31A are in the OFF state respectively.
